

Fabric QA Code Challenge round

Overview:

- Para bank is a realistic online banking application which enables users to manage fund transactions.
- Develop an end-to-end (E2E) test automation framework using Playwright with TypeScript or JavaScript for the ParaBank application, covering both UI and API test scenarios along with CI/CD integration.

URL: <https://parabank.parasoft.com/>

UI Test scenarios:

1. Navigate to Para bank application.
2. Create a new user from user registration page (Ensure username is generated randomly and it is unique in every test execution).
3. Login to the application with the user created in step 2.
4. Verify if the Global navigation menu in home page is working as expected.
5. Create a Savings account from “Open New Account Page” and capture the account number.
6. Validate if Accounts overview page is displaying the balance details as expected.
7. Transfer funds from account created in step 5 to another account.
8. Pay the bill with account created in step 5.
9. Add necessary assertions at each test step whenever it is needed.

API Test scenarios:

1. Search the transactions using “Find transactions” API call by amount for the payment transactions made in Step 8.
2. Validate the details displayed in Json response.

CICD Integration:

1. Integrate the Playwright test automation framework with GitHub Actions.
2. Configure the pipeline to:
 - Trigger automatically on every commit to the repository.
 - Run the full UI + API test suite.
3. After execution send a test report via email including:
 - Total tests executed
 - Number of passed and failed tests
 - Links to screenshots or logs for failed tests
 - Summary of retries or flaky tests

Note: Kindly consider below points while developing the test automation framework.

- Naming conventions, modularization, reusability and readability of code with appropriate project structure.
- Share us the GitHub Project link and reach out to us if any clarifications required.
